Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

| TITLE Mouse whole genome scaffolding with paired end reads from 10kb plasmid inserts JOURNAL Onpublished (2000) CONTECT: Robert B. Weiss CONTECT: Robert B. Weiss University of Utah Genome Center Rm. 308 Biomedical Polymers Research Bidg., 20 S. 2030 E., SLC, UT 84112, USA Tel: 801 585 506 Fax: 801 585 7177 Email: ddunn@genetics.utah.edu Insert Length: 10000 Std Error: 0.00 Plate: Disamile ends High quality sequence stop: 19. Seq primer: CACACACACACACACACACACACACACACACACACACA | 10.5 Kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMD42 (gil4732114) plAT129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance. and selected for ampicillin resistance. and selected for ampicillin resistance. NCI_CGAP_GC4 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1257096-1258631, 146964-1470983, and 1475592-1476743). Subtraction by Bento Soares and M. Fatima Bonaldo. "subtraction by B a 13 c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ORIGIN
double-stranded cDNA was ligated to Sal I adaptors (BRL), digested with Not I and cloned into the Not I and Sal I sites of the pSPORTI vector (BRL). Library was constructed by Matthew Clark (Lehrach lab; ICRF, London and Max Planck Institut fuer Molekulare Genetik, Berlin). CDNAs for EST analysis were selected following oligonuclectide hybridization fingerprinting of arrayed clones from zebrafish late somitogenesis (26 ss), adult liver or embryonic shield stage (5.6 h) libraries. Fingerprint data were used to computationally cluster cDNAs, and a single CDNA from each cluster was chosen for sequencing. In some cases multiple members of the same cluster were sequenced to assess clustering parameters or single clones were sequenced additional times to assess quality
                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

//delingst_b.coll Strain Allo Solu, il resistant, F. //note="Vector: PWAZIV; Purified genomic DNA from M. musculus C57BL/6J (male) was obtained from the Jackson Labotatory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4732114 (pblA129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCK-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1323912-1325831, 1471368-1472903 and H92104-1493255). Subtraction by Bento Soares and M. Fatima Bonaldo. "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             g
musculus C57BL/6J (male) was obtained from the Jackson Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AF129072.1), a copy-number inducable derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymerlectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114 [gilARL29072.1], a copy-number induible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into adaptors competent E. coll XL10-Gold (Stratagene) cells and selected for amplcillin resistance."

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                       9b_htg15:*

Sheiness,D.K., Cangelosi,G.A. and Britschgi,T.B.
Nucleic acid probes useful for detecting microorganisms associated
with vaginal infections
Patent: US 5654418-A 18 05-AUG-1997;
Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 (bases 1 to 24)
Sheiness, D.K., Adams, T.H., Stamm, M.R., Cangelosi, G.A.,
Britschgi, T.B. and Dix, C.K.
Methods for selectively detecting microorganisms associated with
vaginal infections in complex blological samples
Patent: US 5700636-A 18 23-DEC-1997;
Location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                 10-JUN-1998
                                 07-0CT-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              07-OCT-1996

                       The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion Kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, anglogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.

The present sequence represents a PCR primer for flea serine protease. The protease, its mimetopes, antibodies (Ab) and inhibitors of the protease, its mimetopes, antibodies (Ab) and inhibitors of the protease, its mimetopes, antibodies (Ab) and inhibitors of the protease as the DNA encoding the protease activity (especially improtease) and so reduce flea infestation, especially immunoglobulin protease) and so reduce flea infestation, especially in cats or dogs: Alternatively, flea larvae may ingest the faeces of adult in response to administration of the protein. Therapeutic compositions may further comprise a compound that reduces haematophagous ectoparasite in response to administration of the protein. Therapeutic compositions may further comprise a compound that reduces haematophagous ectoparasite activity. The novel flea DNA encoding the protein can also used to produce recombinant protein, and fragments of it are used as probes and primers for identification and isolation of related sequences, also as primers of the protein. Ab are also useful for screening expression libraries, to purify the protein and to target cytotoxins to fleas.

```
The inventors claim a compsn. of at least one oligo probe for the detection of at least one microorganism found in vaginal samples. The sequence below is one such probe. The methods and compsns. can be used for the detection of microorganisms, partic. in vaginal fluid samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Probe; hybridise; ribosomal RNA; vaginitis; infection; diagnostic; ribosomal RNA; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oligo:nucleotide probes for detecting microorganisms in vaginal samples - allows selective detection of vaginitis-causing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligonucleotide probe GV003 specific for Gardnerella vaginalis.

The preferred target for such probes is 16S rRNA, present in several thousand copies per coligonucleotides complementary to sequences in the G.vaginalis genome or in G.vaginalis plasmids may also be used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Sequences AAT89806-T89877 represent novel oligonucleotide probes which allow the detection of microorganisms associated with vaginal disorders e.g. Prevotella bylai, Prevotella melaninogenica, Gardnerella vaginalis, Trichomonas vaginalis, Mycoplasma hominis, Mobiluncus spp., Neisseria gonorrhoeae, Chlamydia trachomatis, Ureaplasma urealyticus, Neisseria gonorrhoeae, Chlamydia trachomatis, Ureaplasma urealyticus, microorganisms associated with vaginitis can be selectively detected using oligonucleotide probes specific for the organism and this can be incorporated into the design of diagnostic kits. These probes hybridise to regions of the ribosomal RNA with minimum secondary and tertiary interactions. Such hybridisation reactions do not require the additional step of heat denaturing the sample nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Probe; Gardnerella vaginalis; Candida albicans; Trichomonas vaginalis; dipstick; non-porous solid support; oligonucleotide-coated bead; vaginal disorder; hybridisation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is the nucleotide sequence of the Gardnerella vaginalis probe used in the method of the invention which involves the production of Kits for simultaneously detection of Gardnerella vaginalis, Candida albicans and Trichomonas vaginalis, which comprised a dipstick with a non-prorus solid support having at least 3 capture oligonuclectide-coated beads attached to it. The kit can be used for detecting microorganisms associated with vaginal disorders.
                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Test kit for vaginal disorders - comprises dipstick with capture oligonucleotide-coated beads, specific for Gardnerella vaginalis. Candida albicans and Trichomonas vaginalis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAT00202-25 and AAT00227-57 represent two groups of ligands to thrombin. These sequences were isolated using the single stranded DNA molecules given in AAT00201 and AAT00226 which comprise a 30N and a 60N variable region, respectively. These ligands were isolated using systematic evolution of ligands by exponential enrichment (SELEX). The selection was conducted in a buffer solution at 37 deg. C. After 12 rounds of selection, no additional improvement in binding was seen. By studying regions of homology between the isolated ligands, a truncated ligand of 38 nucleotides (see AAQ98403-04) was identified which retains high affinity binding and inhibits clotting. These ligands are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   inhibitors of thrombin and are therefore useful in treating thrombin
                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                 systematic evolution of ligands by exponential enrichment; SELEX; heparin; selection; region of homology; inhibitor; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identification of ligands to basic fibroblast growth factor and thrombin - which can be modified for increased in vivo stability

A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of defining a set of oligonuclectides (ONS) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising enerating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria; and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 physical, chemical or bioactive properties.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a purified and isolated non-naturally occurring DNA ligands to basic fibroblast growth factor (bFCF). The ligands are useful as part of gene therapy treatments and for diagnosing pathogenesis of vascular diseases including infitation and progression of atherosclerosis, acute coronary syndromes, vein graft disease and restenosis following coronary angloplasty. The ligands have improved stability in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel nucleic acid ligands to basic fibroblast growth factor that are useful as inhibitors of basic fibroblast growth factors and 2'-amino modified RNA ligands, exhibit increased in vivo stability

                                                                                                                                                                                                                                                                                                                                                                               A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tMA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of defining a set of oligonucleotides (ONS) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria; and (2) a method of defining set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined

The invention includes antisense oligonucleotides AAF94680 - AAF94637 which target a RhoA nucleotide sequence, AAF94645 - AAF94684 which target a RhoB nucleotide sequence, AAF94645 - AAF947545 which target a RhoC nucleotide sequence, AAF94766 which target RhoG nucleotide sequence, AAF94769 - AAF94790 which target a Rac 1 nucleotide sequence and AAF94795 - AAF94809 which target cacd2 nucleotide sequence. The antisense compound is useful for treating hyperproliferative conditions, especially cancer, abnormal wound healing or clotting conditions and isochemia. The compound may also be used to diagnose the above conditions.

oligonucleotides #1, #2 and #3 (AAZ22836-222838) to generate a four-way junction used to assay for any resolvase activity in an extreme thermophilic enzyme composition from Thermotoga maritima. Extreme thermophilic enzymes, such as TW-Endo V (from Thermotoga maritima) cleave at a mismatch formed between two polynucleotides in a duplex. It does not exhibit resolvase activity and does not require a GATC sequence to effect cleavage. TM-Endo V cleaves C/C G/G, T/C, A/A, and T/T mismatch. The enzyme does not cleave a perfectly complementary oligonucleotide pair (no mismatch), a T/G mismatch or a 3 base bubble. It
                                                                                              HWGCoA reductase is the enzyme which defines the rate limiting step in cholesterol biosynthesis. Expression of the gene may be prevented by the formation of a triplex between the duplex target DNA sequence and an anti parallel or parallel synthetic oligonucleotide. A suitable target sequence is the binding site for a repressor protein which appears to mediate end-prod. inhibition of transcription by cholesterol, from base -167 to -135 of HWGCoA reductase gene. Oligonucleotides targetted against this sequence will repress HWGCoA expression, and act as agonists of the cellular repressor. See also AAO36219-362.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated extreme thermophilic enzyme, which cleaves at a mismatch formed between two polynucleotides in a duplex \,

                                                                                                                                                                                                                                                                                        This invention relates to an antisense compound targeted to a nucleic acid molecule encoding a member of the human Rho family of small GTP bidding proteins, where the antisense compound inhibits the expression of the member of the human Rho family. The invention includes antisense oligonucleotides AAF94580 - AAF94637 which target a RhoA nucleotide sequence, AAF94685 - AAF94684 which target a RhoC nucleotide sequence, AAF94759 which target a Rac 1 nucleotide sequence and AAF9476 - AAF94790 which target a Rac 1 nucleotide sequence and AAF94759 - AAF94809 which target a Rac 1 nucleotide sequence and AAF94755 - AAF94809 which target a Cdc42 nucleotide sequence. The antisense compound is useful for treating hyperproliferative conditions, especially cancer, abnormal wound healing or clotting conditions and ischaemia/reperfusion or recoxygenation injury. The compound may also be used to diagnose the above conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Gaps

```
can be used to detect mutations in a target nucleotide or to detect the presence of a non-mutated sequence. In particular, the enzyme can be used for detecting mutations in HIV, sickle cell anaemia hypoxanthine transferase gene, and in genes associated with cancer e.g., p53 and BKCA1. TM-Endo V can be used to cleave mismatches that are created during polymerase, incorporates approximately one incorrect base per 500 bases, which is unacceptable if DNA greater than 500 bp is to be amplified. TM-Endo V cleaves at the mismatch, either on the template or the durther amplification. A chimera of an extreme thermophilic DNA polymerase and TM-Endo V can accomplish the dual roles of PCR plus correction of erroneous base incorporation.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (qil4732114(pblAF129072.1), a copy-number inducible derivative of plasmid Rl. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLIO-GOld (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           δλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMD42 (gil4732114) iplant29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with 74 DNA polymerase and 74 polymerase at a polymerase and 74 polymerase to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarcse gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gild/32114 gblaka129072.1), a copy-number inducible derivative of plasmid Rl. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLIO-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Rm. 308, Blomedical Polymers Research Bldg., 20 S. 2030 E., SLC, UT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                õ
                                                                                                                                                                                                                                                                                                                                                                                 // ALCOURTED SIZE IN ALID 'SOLD, 'TITESISTARIL,' FT. // ALCOURSE E. COLD SIZE IN ALID 'SOLD,' TITESISTARIL,' FT. // ALCOURTED SIZE IN ALID 'SOLD,' TITESISTARIL,' FT. // ALCOURTED SIZE IN ALID 'SOLD,' TITESISTARIL,' FT. // ALCOURTED SIZE IN ALID SECONDER (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with TONA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of puble ALID SIZE IN A copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically competent E. Coll XLIO-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                õ
                                                                                                                                                                                                                                                                                                                                                                                                                            ద
                                                                                                                                                                                                                                                                                                                                                                                                                                        (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil473214 glp.HE129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Suzuki,Y., Tsunoda,T., Taira,H., Mizushima-Sugano,J., Sese,J., Hata,H., Ota,T., Tsunoda,T., Tanaka,T., Nakamura,Y., Morishita,S., Okubo,K., Suyama,A. and Sugano,S.
Fine Structural analysis of transcription start sites of human mRNAs using full-length enriched and 5'-end enriched cDNA libraries Contact: Yutaka Suzuki

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to
,S. Construction and characterization of a full length-enriched and a 5'-end-enriched cDNA library. Gene 200 (1-2), 149-156 (1997). Location/Qualifiers

electrophoresis. Vector DNA was prepared from a derivative electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114[gb]AF129072.1), a coopy-number inductble derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into adaptoretent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /Jab_host="E. Coli strain XL10-Gold, T1-resistant, F-"
/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus G57BL/60 (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil4732114) [plARL29072.1], a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the linsert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."
